[Hiring Manager's name, if you can find it]

[Team or department]

[Company name]

[City, Country]

Dear [Name — or "Hiring Team" if you genuinely cannot find one],

I am applying for the [exact role title from the posting] internship at [Company], which I found via [where you saw it]. I am a Computer Science undergraduate at Obafemi Awolowo University, and I have spent the past year working as a full-stack developer alongside the degree — so I would be joining you already used to shipping code that other people depend on.

Most of that time has gone into Vouchmark, a KYB and trust-scoring platform for African markets, across its backend, frontend and admin services. The work I am proudest of there was consolidating billing onto a wallet ledger as the single source of truth for money, and making checkout initialisation idempotent behind a payment-intent table so one user cannot open several checkouts and pay each of them separately. Webhook replay was already handled; the charges were being created upstream of it. That is most of what I now believe about money in software: the number has to be provable, not merely computed.

I build my own systems for the same reason. Keyhold is a peer-to-peer property marketplace where I gated escrow release by both role and time — the buyer or an admin may release at any point, the seller only once the inspection window has closed — and made settlement move escrow, transaction and property status together, so a completed sale cannot leave the listing browsable. Waypoint is a trip booking platform built on the Amadeus GDS, where I implemented the offer re-pricing call that reconfirms a fare before booking, because a stale search result sold at the wrong price is the kind of bug a customer finds before you do. [Name whichever of the two is closest to what this company does, and say in one sentence what it has in common with their problem.]

[WHY THIS COMPANY — two or three sentences, and the part you must not fake. Name something specific: a product decision, a technology in their stack you have used, an engineering blog post, the problem domain. Then say what you want to learn from them. If you cannot fill this in honestly, you have not researched the company enough to apply.]

I graduate in 2028 and am looking for an internship where I can work on production systems alongside engineers more experienced than me. I would welcome the chance to talk about the role, and I am available [your availability window]. Thank you for your time and consideration.

Yours sincerely,

Aderibigbe Emmanuel

Before sending — delete this box and every highlighted slot. Address a named person wherever you can find one; "Hiring Team" is the fallback, never "To Whom It May Concern". Keep it to one page. Send as PDF, named *Aderibigbe-Emmanuel-Cover-Letter-[Company].pdf*. The fourth paragraph is the only part a reader can tell you wrote for them specifically — it is worth more than the other four combined.
